Objectives

- Professional website design
- Clear and organized content presentation
- Interactive and responsive user experience
- Practical front-end implementation

Motivation

- Build a portfolio for future use
- Practical front-end application
- Personal and professional growth

Technical Architecture

Structure:

HTML → Structure

CSS → Design

JS → Logic

Key implementation elements

- localStorage to remember the selected theme
- Fetch request to load repositories from GitHub
- DOM updates for filtering, sorting, and form messages

Live Demo

AI Integration

- ChatGPT for understanding and debugging
- Copilot for drafting and suggestions
- AI support for UI and logic
- Reviewed and edited outputs

Main Technical Challenges

- Resolved and implemented in the web application
  - Theme persistence using localStorage
  - Project filtering and sorting
  - Dynamic GitHub API integration
- Unresolved and not implemented in the web application
  - Backend connection for the contact form
- Planned for future work
  - Connect the form to a backend service
  - Add more project content

Innovation

- Dynamic GitHub repository display
- Saved theme personalization
- Time-based greeting message
- Interactive project filter and sort
- Turning a static portfolio into an interactive experience

What I Learned

- Front-end project structure
- Practical DOM manipulation
- Meaningful use of localStorage
- API data fetching and display

Conclution

What the project achieved

- A complete personal portfolio website
- A responsive and interactive interface
- A deployed website available online

Future direction

- Backend support for the form
- Additional project sections

Thank You
